CLAIMS

- 1. A method for sensing the context of an electronic device, the method comprising: receiving contact information which represents a contact pattern acting on the device; determining a contextual characteristic associated with the contact pattern; determining a function operational in response to the contextual characteristic; and executing the function.
- 2. The method of claim 1, further comprising the step of determining a contextual
 characteristic of the device in relation to a foreign object in response to receiving
 the contact information.
 - 3. The method of claim 2, further comprising the step of determining a contextual characteristic of the device in relation to a user.
 - 4. The method of claim 1, wherein the step of receiving contact information further comprises selectively receiving a plurality of signals from a plurality of touch sensors which represent the contact pattern.
- 5. The method of claim 4, wherein the step of receiving contact information further comprises selectively receiving a signal from a context sensors which senses the proximity of a foreign object.
 - 6. The method of claim 5, wherein the step of determining a contextual characteristic further comprises receiving signals from a context sensor which is any one of an infrared sensor, an ambient light sensor, a camera, a microphone, a radio frequency signal sensor, radio system signal strength detection circuit.
- 7. The method of claim 6, further comprising the step of executing a function based on the received signal from the context sensor and the contact information.

10

20

- 8. Them method of claim 2, wherein the contextual characteristic is one of a plurality of predetermined configurations in which the device is held by the user.
- 9. The method of claim 1, executing a first function which corresponds to a first contact pattern and in response the device operating in a first operation mode.
 - 10. The method of claim 9, adjusting a level of a user interface of the device to a first level in response to a first contact pattern and a first operation mode, and adjusting the speaker to a second level in response to a second contact pattern and the
 - first operation mode.
 - 11. The method of claim 9, activating a first user interface in response to a first contact pattern and a first operation mode, and
- deactivating the user interface in response to a second contact pattern and the first operation mode.
 - 12. The method of claim 10, wherein the user interface is one of a display a speaker, haptic feedback device, a microphone, a camera, a keypad, or a touch screen.
 - 13. The method of claim 7, wherein the user interface is one of a display a speaker, haptic feedback device, a microphone, a camera, a keypad, or a touch screen.
- 14. The method of claim 9, turning on a speaker phone in response to a first contactpattern and a first operation mode, and
 - turning on an earphone speaker in response to a second contact pattern and the first operation mode.

10

20

25

- 15. The method of claim 1, further comprising the step of determining a contextual characteristic of the device in relation to a foreign object in response to receiving the contact information.
- 5 16. The method of claim 2, further comprising the step of determining a contextual characteristic of the device in relation to a user.
 - 17. The method of claim 1, wherein the step of receiving contact information further comprises selectively receiving a plurality of signals from a plurality of touch sensors which represent the contact pattern.
 - 18. A method for sensing the context of an electronic device, the method comprising: receiving touch sensor information from at least a subset of touch sensors for a plurality of touch sensors;
- determining a contact pattern which corresponds to the subset of touch sensors; receiving contextual information at the device;
 - determining the position of the device relative to a foreign object based on the contact pattern;
 - determining a function operational in response to the position of the device and the and the received contextual information; and executing the function.
 - 19. The method of claim 18, determining the position of the device relative to a user's body.
 - 20. The method of claim 18, receiving touch sensor information from at least a subset of touch sensors for a plurality of touch sensors that indicate that a user is holding the device in a first gripping configuration.
- 30 21. A method in a wireless communication device comprising:

receiving a plurality of input signals from corresponding capacitive touch sensors carried on a housing of the wireless communication device;

- determining a touch pattern corresponding to the plurality of input signals received from the capacitive touch sensors;
- determining a relative position to a foreign object; and activating an event in response to receiving the plurality of input signals and the motion input signal.
 - 22. An electronic device comprising:
- 10 a housing;

15

20

- a microprocessor;
- a plurality of touch sensors carried on the housing an activatable from the exterior of the housing, wherein the location of each touch sensor of the plurality of touch sensors is configured to determine the poison of foreign objects relative to the housing; and
- a context sensor module coupled to the microprocessor and receiving input from the plurality of touch sensors.
- 23. The device of claim 22, wherein a first touch sensor is on a first side of the device.
- 24. The device of claim 23, wherein a second touch sensor is carried on a second side of the housing.
- 25. The device of claim 24, wherein the first side is a left, right, top, bottom, from or back side of the device, and wherein the second side is a left, right, top bottom, from or back side of the device.
 - 26. The device of claim 25, wherein the touch sensor is a capacitive touch sensor.
